

SHAFT HUB CONNECTIONS

LOCKING DEVICES
SHRINK DISCS
LOCKING ELEMENTS
RIGID SHAFT COUPLINGS

KBK – The Company

KBK Antriebstechnik GmbH - successful since 2003

Our products are based on the experience of more than 30 years in developing and producing shaft-hub-connections and backlash-free couplings combined with professional advice, service and professional competence. Our sophisticated modular design forms the basis for top quality products at reasonable prices. It enables us to produce almost all elastomer-, metal bellows-, safety couplings and line shafts as well as locking devices from the standard range within two hours, provide them with customized bores and organize a direct delivery to you by courier. Our traffic-favourable position on the edge of the Rhine-Main area simplifies the delivery to our customers all over the world. Benefit from our strenghts and our strong motivation to satisfy all our business-partners and safe time and money for your company.

Hub dimensioning for the use of KBK locking devices

Preliminary design of the hub

The hub material is stressed by the surface pressure on the hub (see also information in the technical data sheets). To prevent a slight separation / destruction of the hub by the locking device, the minimum outer diameter of the hub should be taken into consideration for the dimensioning. This depends on the material, mounting conditions and the surface pressure generated by the locking device.

When choosing the material it has to be ensured, that the surface pressure of the locking device on the hub must not exceed the yield strength $R_{p0.2}$ of the hub material.

The following tables show multipliers (K) depending on the yield strength and the mounting conditions, by which the minimum outer diameter of the hub can be roughly determined.

This rule applies: $DN = D \times K$

(D = outer diameter of the locking device; K = installation factor)

$$B \geq L1 : X = 1$$

$$B \geq 2 \times L1 : X = 0,8$$

$$B > 2 \times L1 : X = 0,6$$

Surface Pressure [N/mm ²]	Stress Reduction Factor X	Yield strength of the hub material (N/mm ²)
